Remote or hybrid · open to a test assignment

SUMMARY

I build systems where a language model works inside a business process: customer-facing chatbots, automation of routine operations, content-generation pipelines. In 2026 I took seven projects from idea to a working stand, from an AI receptionist for a dental clinic on n8n and PostgreSQL to a TypeScript video factory that renders series of 100 clips with no human in the loop.

Claude Code, OpenAI and Gemini APIs are my primary development tools. Strengths: problem framing, decomposition, quality control through tests, linters and measurements. I write documentation that both people and models read: project rules, architecture decision records (ADR), runbooks. Projects are under NDA, so the code is not public; a detailed technical CV is available on request.

SKILLS

Languages and frameworks: Python 3.12 (FastAPI, aiogram, asyncio, pydantic, SQLAlchemy, pytest), TypeScript / JavaScript (Node.js, React, Remotion), SQL

AI and LLM: Claude Code, Anthropic API, OpenAI API, Google Gemini (text, TTS), RAG on pgvector, prompt engineering, MCP servers, Whisper, Suno, ElevenLabs

Automation: n8n (workflows in git, idempotency, error handling), Telegram Bot API and Mini Apps, ZennoPoster, scraping and browser automation

Databases and infrastructure: PostgreSQL 16 + pgvector, Supabase, Docker Compose, WSL2, Linux, Git / GitHub, GitHub Actions (CI/CD), Railway

Other: OCR pipelines (Marker, Surya, PyTorch), code-first CAD (CadQuery), ffmpeg, OBS, Webflow, WordPress, SEO

Languages: Ukrainian, Russian — native; English — intermediate, technical documentation and code

EXPERIENCE

AI Workflow Engineer / Developer (self-employed)

Jan 2026 — present

Projects for the Estetium dental clinic and own products

- **Dental AI Automation.** Telegram bot on n8n + PostgreSQL/pgvector + LLM that answers patients' questions about services, sends appointment reminders and escalates complaints to staff. 10 production workflows, 32 architecture decision records, 200+ pull requests. Bot response time around 2 s.
- **Video factory for social media.** TypeScript and Node.js pipeline: script, voice-over (Gemini TTS), in-frame drawing and rendering are assembled by scripts from JSON. 30 topic sections; series of 100 clips render on schedule with no human in the loop. Custom "drawn in frame" engine on Rough.js.
- **Song Service.** Telegram bot for HoReCa venues: a personalised song for a guest in 3–5 minutes via the Suno API. Python, aiogram, Supabase, CI/CD on GitHub Actions, tests, strict typing.
- **Stream Director.** Python "director" for a live stream: drives OBS, reads YouTube and TikTok chat, voices the host via TTS, runs interactive viewer battles.
- **OCR pipeline.** Recognition of 18 scanned PDFs on a local GPU and assembly of a single 130-page document with tables.

Marketing and Digital Strategy Specialist

2025 — 2026

Estetium dental clinic (Kyiv) and other projects

- Brand positioning, website migration and technical optimisation (Webflow, WordPress), SEO and JSON-LD structured data.
- AI in content production: service videos with synthesised voice-over, audience analysis.

Automation and Algorithmic Analysis Developer (self-employed)

2014 — 2025

Online platforms, social networks

- Bot networks on ZennoPoster running hundreds of accounts at once: registration, templated actions, transaction accounting. Started with visual flowcharts; over the years moved on to database design and system architecture.
- Analysis of odds, volatility and platform logic; risk-minimisation algorithms based on overlapping events.
- Social media automation: content managers' routine turned into templated processes.

EDUCATION

Master's degree in Electrical Engineering, electrical systems and power supply · National University of Food Technologies (NUFT), Kyiv · 2010

CS50 and related computer science courses: algorithms, data structures, complexity analysis
